

Micro- and Ultrafiltration Performance Specifications Based on Microbial Removal

The research reports details the assessments used to develop a systematic performance testing protocol and specification for microfiltration (MF) and ultrafiltration (UF) membranes with respect to removal of viral and submicron bacterial pathogens. It includes a peer-reviewed protocol and performance specification based on data developed in the bench-, pilot- and full-scale testing for this project. Key issues included the use of microbial surrogates for enteric viruses, and the impact of membrane characteristics, membrane operation and water quality variables on microbial removal.
