

Fibrinolysis in Disease: Molecular and Hemovascular Aspects of Fibrinolysis

Fibrinolysis in Disease reviews the state of the art of basic and clinical aspects of the fibrinolytic enzyme system. The text, authored by outstanding and internationally known investigators, is presented in two books. The Malignant Process, Interventions in Thrombogenic Mechanisms, and Novel Treatment Modalities discusses the molecular biology of the systems key components and their fundamental roles in a variety of thrombotic and metabolic disorders. Molecular and Hemovascular Aspects of Fibrinolysis presents the latest findings and concepts of the association between plasminogen activator (u-PA) overexpression and abnormal growth regulation in a variety of solid tumors and in leukemia. One chapter deals with various successful interventions in thrombogenic mechanisms, ranging from exercise and diet to anticoagulants and direct and indirect thrombolytic agents. It concludes with a projection of exciting, novel treatment modalities in thrombotic and malignant diseases.
