

Seminar on Fission

This volume constitutes the proceedings of the fourth meeting in a series of topical conferences dealing with the process of nuclear fission, mainly at low excitation energy. Two chapters deal with the characteristics of one of the major fission observables, in other words, the fission fragments. The book also gives due attention to an often-neglected area of fission, the so-called ternary fission (fission accompanied by a charged light particle). Another chapter deals with fission barriers and cross sections and the link with astrophysics. Special attention is also given to applications such as accelerator-driven systems and transmutation. The last chapter discusses various interesting aspects of nuclear fission.
