

Irish naturalist Volume 17

This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1908 Excerpt: ...Gf *Lamellaria perspicua*, four living specimens were taken here, all of the same dirty yellow hue as those previously dredged by us from the same ground. A few samples of the sponges and zoophytes were brought home in a jar of sea water, and these on careful examination yielded me the following interesting Opisthobranchs;--*Runcina Hancocki*, 2. *Goniodoris castanea*, 1. *Ijgires punctilucens*, r. *G. nodosa*, 2. Of these, *Goniodoris castanea* is new for Co. Dublin and for east Ireland, and appears to have been only twice previously recorded for the Irish coasts, the first time from Dursey Sound, the second from Ballinakill Harbour. The Malahide specimen agreed perfectly in coloration with the plate in Alder and Hancocks Monograph. For *Ijgires* there is only one previous Co. Dublin record. The occurrence of *Runcina* here and at Bullock, some 12 miles south of Lambay, where it was added to the Dublin marine fauna by Mr. Wolleston in 1906, shows that the species is widely distributed in the county. December 14.--The Committees last dredging trip for the year was made on this day, the ground selected being Dalkey Sound and its approaches. The Treasurer was the only representative of the Committee present, and operations were carried on from a row-boat, manned by two Bullock fishermen well acquainted with the soundings and the nature of the bottom. Only four scrapes were made altogether, two in 10 fathoms a little south of Bullock Harbour, one in midSound in about 8 fathoms, and a fourth in 15 fathoms, about a quarter of a mile south-east of the Battery on Dalkey Island. Amongst the results of the first two scrapes, the following are of

interest--: Tie Polyceras were all of the typical form citrina, warm orange brown in colour, and the Tritonia was quite imm...
